

Séminaire sur la complexité

23 Mai 2018 – 24 Mai 2018

Many unsolved social and natural problems of interest cannot be confined to mono-disciplinary research. They demand instead an interdisciplinary approach where the experiences issued from different domains contribute to create new knowledge.

Complex systems are ubiquitous; they involve different fields of knowledge and appear at different scales. From the gene-protein networks, to the level of the organism and further on, to the social and/or economic organizations, living beings provide excellent examples of complexity.

The aim of this conference is to contribute to the construction of this new approach to the study of complex problems in each of the involved disciplines. It is an international and interdisciplinary conference where international specialists working in complexity will join their colleagues from Parisian region.
